

Ranco Dental CRM

Single-clinic setup. Admin and Doctor panels only — no patient login yet. This lays out the entities, relationships, and access rules discussed so far, before any code gets written.

System shape

React (Vite) serves both panels on web; the same build gets wrapped by Capacitor for the mobile app. One Python API sits behind both. Postgres lives on Render; files (X-rays, documents) live in an S3 bucket on AWS.

Core entities

A patient can run several treatments at once, each with its own doctor. Billing now settles at the *treatment* level — one invoice generated when the treatment is marked finished, itemizing every visit under it. The prescription runs separately: one continuous timeline per patient, fed by whichever visit happens, no matter which treatment or doctor it's under.

Entity fields

What each record actually carries. Enum-like fields are shown as pills so state is visible at a glance.

PATIENT

added by Admin or Doctor

name	string
phone	string
dob	date
medical_notes	text
added_by	staff_id

SERVICE

catalog — Admin only

name	string
listed_price	decimal
active	active

TREATMENT

one per service a patient opts into

patient_id	fk
service_id	fk
doctor_id	fk → staff
status	ongoing

VISIT

one per sitting — carries that sitting's charge

treatment_id	fk
visit_date	date
listed_price	decimal
discounted_price	decimal
payment_status	unpaid

PRESCRIPTION_ENTRY

one per visit, feeds the patient's single timeline

patient_id	fk
------------	----

INVOICE

generated once, at treatment completion

treatment_id	fk
--------------	----

visit_id	fk	listed_total	decimal
entry_date	date	discount_total	decimal
notes	text	final_total	decimal
added_by	staff_id		

STAFF	
Admin and Doctor accounts	
name	string
role	admin / doctor
specialty	string

Who can do what

Same actions for both roles — the difference is scope. Admin sees the whole clinic; a Doctor sees their own assigned cases. Both can add a prescription entry at any visit.

CAPABILITY	ADMIN	DOCTOR
Add a patient	✓	✓
Manage services & pricing catalog	✓	—
Start a treatment & assign a doctor	✓	✓
Log a visit (prescription / notes)	✓	✓
Mark a visit paid / unpaid	✓	✓
View patients & cases	all clinic	own only
Revenue & reporting	✓	—

Open questions

Things worth pinning down before this turns into code.

Who applies the discount

The doctor negotiates in the room — do they enter the discounted price directly on the visit, or does it route through Admin for approval past a certain amount?

Traceability across treatments

Since the prescription is one timeline per patient but a patient can have several treatments (and doctors) running at once, should each entry visibly show which treatment/doctor it came from when viewed in the combined feed?

Treatment finished, but a visit's still unpaid

If a treatment is marked finished while one of its visits is still unpaid, does the invoice generate anyway (showing an outstanding balance), or does "finished" get blocked until every visit is settled?

Patient login, later

No patient-facing access in v1. When it arrives, it'll likely be read-only against the same API — visit history, invoices, upcoming appointments.

concept only – no code written yet
